

J/ψ proton dissociation: H1 and ZEUS test different ranges

Published photon-level cross sections; data values and energy ranges are not rescaled

Figure 1 comparison: $W = 100$ GeV

H1 data reaching small $|t|$: $W = 75$ GeV

Left data: ZEUS $80 < W < 120$ GeV; H1 total $50 < W < 150$ GeV. Right data: H1 $40 < W < 110$ GeV.

Model curves use $Q^2=0$ and representative W ; GBW includes geometry fluctuations with no breakup-mass selection.

Bars show published uncertainties (ZEUS: stat + syst + dissociation model; its extra 10% normalization is separate).
